106 13 20 101 13 Table 6. Results of test sensitivity and specificity for the various aspects of test
accuracy calculation based on a total of 300 samples. Note that there is no change in the total
number of positive and negative cases for any aspect of accuracy calculation as a result of the
change in regression approach. Notes on the tables The Table does not contain the proportion of
cases classified as positive and negative due to the asymmetric nature of certain aspects of
accuracy calculations. For example, the sensitivity and specificity of diagnosing liver cancer are
computed from liver disease incidence statistics and the sensitivity and specificity of diagnoses of
other diseases are computed from the number of cases detected as positive and negative for the
disease. Therefore the calculation of these aspects of accuracy does not follow the same pattern.
The frequency tables for these aspects of the calculations are as follows: As already mentioned,
Table 6 does not include the frequency of the proportion of cases classified as positive and negative
in each of the aspects of accuracy calculations. In this case a sensible workaround is to refer to Table
7, which shows the same information as Table 6. The tables for the two most common aspects of
accuracy calculation (sensitivity and specificity) are displayed. Table 7. Diagnostic test accuracy in
the presence of an unknown prevalence - The proportion of positive and negative cases. It should be
noted that the table is asymmetric, as already mentioned. The advantage of Table 7 over Table 6 is
that 6d1f23a050
